The print medium is typically traversed or indexed under the print head during the printing process. In conventional printing systems, a video data stream representing a series of image pixels is converted to a digital representation. the digital representation is used to drive an ink jet printing engine, which includes a plurality of drop ejectors that expel droplets of ink through a plurality of nozzles onto the print medium to form the desired image. The digital representation of the image is also used to operate a print medium drive such as an actuator that moves the print medium with respect to the print head. In printing systems using a continuous roll of print medium, the media must be incrementally advanced in a controlled manner, particularly near the end of the print job, to properly position the print medium with respect to the print head and to locate the print medium with respect to the nozzles. Even while printing, conventional printing systems must be maintained in an orderly state in order to be able to continually transfer information of the physical parameters of the print head. Conventional printing systems therefore must operate within closely controlled boundaries that impact all aspects of the systems operations. In conventional printing systems, video and print medium position information are often managed by a single controller that is responsible for all aspects of the print job. This controller manages the video information as well as the print media and the print engine. Such a controller is typically responsible for storing a job data stream and initiating other printing functions. If the controller

fails, the printing system is no longer able to perform the functions that are essential for the printing process. It would therefore be desirable to have a printing system and an associated process that provides for a print engine that does not utilize a single controller for controlling the video and print media. The process would be more reliable because an auxiliary engine could be used to store the video data. It would also be desirable to have a print engine that ba244e880a
