What's New In MdspDuckDelay?

This VST plugin creates a delay whose output is compressed when there is a certain amount of signal present on its input. It was developed to be a delay whose output is compressed when there is a certain amount of signal present on its input. It allows to use a lot of delay on a voice without losing too much intelligibility. This plugin introduces a new concept to VST plugins. It compresses the output to avoid a damped sound. I use this feature to provide you with a really powerful delay effect, that can be combined with several other effects and amplifiers. You can imagine to add a delay with a compressor. The VST plugin outputs a normal delay, but in addition to that, when there is a certain amount of signal on its input (threshold) it automatically compresses the delay output signal. Delays with the compressor effect can be combined to create stunning timbral effects.

3 Ways to Compress a Delay: Gain-less Compressors: This method is the one I use to introduce you to a powerful concept for VST. You don't need any gain to compress the delay output. Imagine to use this delay as a background (sound) effect to any track. Like a low-pass or band-pass filter, the delay can be used with almost any other effects. But, what if you have some of them going on and you want to introduce some compression? No problem. If you want to compress a delay with a compressor, all you have to do is to follow these simple steps: 1- Normalize the delay's output (using the settings of the delay) 2- Choose the compressor effect (check the compressor box) 3- Set the gain of the compressor to a value below one.

Auto Compressor: This method is ideal for those, who need to have the compressor feature without having to follow the previous steps to achieve the same goal. Auto-Compressor has two different modes. - Standard: This is the "main mode" - Hybrid: In this mode you can choose the amount of compressor (or decibel) you want to use. You can also have the compressor enable all the time, or disable it. You can also have the compressor affect the feedback of the delay, or not. This means that you will hear the delay only if there is a signal on its input. These features are really powerful and they don't make the delay's sound damped
